About Us

The Board Viewer tool is part of the IWB (Interactive Whiteboard) common file format project.

The project created an interoperable IWB file format which would allow files to be shared across different software programs.

This Board Viewer is a tool which can support technical testing of resources produced in the interactive white board common file format, and is also useful for teaching staff to preview IWB format files where they may not have access to their normal IWB software; much like the way Adobe Acrobat Reader™ allows a user to read .PDF files.

The Board Viewer is deliberately limited in functionality as it is not designed to compete with commercial applications.

Changes made to the IWB files when previewing, such as annotations, cannot be saved and a full featured IWB application should always be used for teaching situations.

The Board Viewer and the associated code libraries are released under Open Source licenses in line with UK Government recommendations, and the viewer is available for community development.

The project source files and project information can be found at
